C -! FUNCTION: May be involved in the regulation of photosystem II.

C -! FUNCTION: May be involved in the regulation of photosystem II.

C -! FUNCTION: By light.

C -! SIMILARITY: Belongs to the psbp family.

XM Photosynthesis; Photosystem II; Chloroplast; Thylakoid; Membrane;

KW Multigene family.

-:- SUBCELLUIAR DOCATION: Chloroplast thylakoid membrane; associated with the photosystem II complex (By similarity).

-:- MISCELLANBOUS: On the 2D-gel the determined pl of this protein (Spot NIT9) is: 5.9, its MW is: 2.2 kDa..

-:- SIMILARITY: Belongs to the psbb family.

-:- SIMILARITY: Belongs to the psbb family.

Peptide sex hormones inducing conjugation tube formation in
compatible mating-type cells of Tremella mesenterica.";
Science 212:1525-1527(1981)
-! FWATION: Tremerogen A-10 is produced by the a mating-type cells
and induces formation of conjugation tubes in a mating-type cells.

venom of Conus marmoreus.";

J. Biol. Chem. 275:39516-39522 (2000).

-!- FUNCTION: Inhibits the neuronal noradrenaline transporter.
-!- SUBCELIULAR LOCATION: Secreted.
-!- TISSUB SPECIFICITY: Expressed by the venom duct.
-!- MASS SPECTROMETRY: MW=1262.77; MW ERR=0.07; METHOD=Electrospray.
-!- SMILLARITY: Belongs to the chi/lambda-conotoxin family.

Neurotoxin; Toxin; Hydroxylation.

(LUDW-) LUDWIG INST CANCER RES

Cendron A; Stacker S, Achen MG, Hughes RA,

WPI; 2001-442248/47

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

cyclising the peptide by oxidising the cysteine residues. The monocyclic cyclising the peptides (comprising 2 linked monocyclic peptides) dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, concaveration or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold tramma, substance-induced neovascularisation of the liver, excessive cramma, substance-induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver sequelae, hypertension induced neovascular sequelae, or chronic liver care sequelae, hypertension induced neovascular sequelae, or chronic liver care infection. The peptides are also used to modulate vascular permeability or brain. The peptides are used to inage blood vessels and lymphatic or brain. The peptides are used to inage blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or D and care also used in combination with an anti-inflammatory agent, to treat a continuous control archivity induced by VEGF, VEGF-C or D and care also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, when an anti-inflammatory agent, to treat and care also used in combination with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat and also used in combination with an anti-inflammatory agent, to treat and also used in combination with an anti-inflammatory agent, to treat and also used in combination with an anti-inflammatory agent, to treat and also used in combination with an anti-inflammatory agent, to treat and also used in combination with an anti-inflammatory agent, to trea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human USGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-cc peptide loop fragment from an exposed loop of a growth factor protein and cyclis peptides by oxidising the peptide by oxidising the peptide of comprising 2 linked monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior corpitation are used to interfere with angiogenesis.

CC cyclisation are used to interfere with angiogenesis.

CC croyalisation are used to interfere with angiogenesis.

CC croyalisation is diabetic retinopathy, peoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation or lymphangiogenesis.

CC frauma, substance-induced neovascular sequelae, nypertension induced neovascular sequelae, hypertension induced neovascular sequelae, nypertension induced neovascular sequelae, hypertension induced neovascular sequelae, nypertension induced neovascular sequelae, nypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a communation in peripheral limbs or in lungs, peritone and lymphatic corputation in peripheral limbs or in lungs, peritone and lymphatic corputation with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a corput corputation in peripheral activity induced by VEGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ..

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.

Example 25; Page 47; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human vector (wascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betact carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, corphyronaccial and account of the condition of the co Cerebrovascular accident, mailigiant to relight the condition of the liver, become trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability an amammal has a condition characterised by fluid or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat abronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human (WGSPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-comparing the comparing the peptide by oxidising the peptide by oxidising the peptide by oxidising the proposite autiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and comparing the comparising 2 linked monocyclic peptides, and a cyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior comparation are used to interfere with angiogenesis.

CC cyclisation are used to interfere with angiogenesis.

CC covascularisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC fracebrowascular accident, post-angioplasty restenosis, head, heat or cold crecebrowascular accident, post-angioplasty restenosis, head, heat or cold crecebrowascular accident, post-angioplasty restenosis, head, heat or cold crecebrowascular accident daysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or dirronic liver infection. The peptides are also used to modulate vascular permeability cor brain. The peptides are used to image blood vessels and lymphatic cor brain. The peptides are used to image blood vessels and lymphatic corputation in peripheral limbs or in lungs, peritoneal cavity, pleura, accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, caccumulation in peripheral limbs or in lungs peripheral activity induced by VEGF Cor D and are also used in combination with an anti-inflammatory agent, to treat a corputation inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

This sequence is a fragment of feline immunodeficiency virus (FIV) glycoprotein 130. Peptides AAY57038-Y57039 are used in the invention as capture polypeptides when diagnosing FIV infection. The invention relates to an antibody binding composition which consists of an enhanced capture polypeptide, which contains an immunogenic fragment of FIV gag precursor p55, and a second fragment which is part of the env precursor gp130, and an antibody-binding detection composition. The invention also includes a device for performing an assay which determines whether a feline is infected with FIV. The novel method is used for the diagnosis of Feline Immunodeficiency Virus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunoglobulin binding peptide; autoimmune disease; rheumatoid arthritis; multiple sclerosis; myasthenia gravis; immunosuppressive; antirheumatic;
                                                                                                                                                                                                                                                                                                                                                                                           Gaps

antigen receptor V-beta chain CDR3 region sequences accumulated in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to peptide sequences present in the synovial fluid and membranes of rheumatoid arthritis patients, arising from the CDR region of oligoclonal pathogenic T-cell antigen receptor Vbeta chains. Compositions which contain autoantigenic peptides binding specifically to
                                                                                                                                             New immunoglobulin-binding peptides, useful for removing autoantibodies from serum, e.g. for treating rheumatism, also related solid phases.
                                                                                                                                                                                                         The present invention relates to immunoglobulin binding peptides. These can be used to remove autoantibodies from solutions, particularly autoantibodies associated with autoimmune diseases such as rheumatism, multiple sclerosis and mysathenia gravis, from body fluids. The present sequence is a peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   atoid arthritis; arthrosis deformans; T-cell antigen receptor; chain; autoantigen; immunological tolerance.
                                                                                                                                                                                                                                                                                                                 Score 32; DB 5; Length 13;

Immunoglobulin binding peptide; autoimmune disease; rheumatoid arthritis; multiple sclerosis; myasthenia gravis; immunosuppressive; antirheumatic; neuroprotective.
                                                                                                                                                                                                                                                                                                                                       The present invention relates to immunoglobulin binding peptides. These can be used to remove autoantibodies from solutions, particularly autoantibodies associated with autoimmune diseases such as rheumatism, multiple sclerosis and myasthenia gravis, from body fluids. The present sequence is a peptide of the invention
                                                                                                                                                                                                                                                                           New immunoglobulin-binding peptides, useful for removing autoantibodies from serum, e.g. for treating rheumatism, also related solid phases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Homing peptide; organ; tissue; lung; pancreas; skin; retina; MDP; prostate; ovary; lymph node; adrenal gland; liver; gut; tumour; membrane dipeptidase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to peptide sequences present in the synovial fluid and membranes of rheumatoid arthritis patients, arising from the CDR region of oligoclonal pathogenic T-cell antigen receptor Vbeta chains. Compositions which contain autoantigenic peptides binding specifically to T-cells expressing receptors containing the peptide sequences, which include antigen-specific immunological tolerance to rheumatoid arthritis can be used for the treatment and prevention of rheumatoid arthritis. The invention can be used for the diagnosis, treatment and prevention of rheumatoid arthritis. Sequences ANY66771-958 represent peptides from the various Vbeta chains of T cell antigen receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               T-cell antigen receptor V-beta chain CDR3 region sequences accumulated in synovial membranes of rheumatoid arthritis patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

e.g. New peptides which selectively home to organs or tissues, used for, e.didentifying target ligands and for therapy of pathological conditions.

Example 6; Page 144; 193pp; English

The present invention describes peptides that selectively home to a tissue or organ. The peptides can be used for identifying an organ or tissue, for identifying a target molecule expressed by an organ or tissue or for treating an organ or tissue pathology, where the organ or tissue is selected from prostate, lung, skin, retina, pancreas, gut, ovary, adrenal gland, liver, and lymph node. The peptide bind to the membrane dipeptidase (MDP). AAV48018 to AAV49066 represent sequences which are used in the exemplification of the present invention. (Updated on 20-MAR-2003 to correct PR field.)

immunotherapy of cancer New tumor-associated antigen 9D7, useful e.g. for immur and for producing diagnostic or therapeutic antibodies.

Claim 6; Page 45; 50pp; German.

This invention describes a novel tumor-associated antigen, designated 9D7 which has cytostatic activity. The invention also describes a method for isolating (a) a polypeptide (I) that includes (SI) as part of its sequence; (b) an immunogenic protein fragment or peptide (II) derived from 9D7; (c) a pharmaceutical composition containing at least 1 of 9D7, I) or (II) as active ingredients; (d) an isolated DNA (III) encoding a protein (IV) with the immunogenic properties of 9D7 or its fragments; (e) a recombinant DNA (IIIa) that includes (III); and (f) antibodies (Ab) directed against 9D7, (I) or (II). 9D7, or its derived immunogenic

peptides, are used to induce a humoral and/or cellular response for use in in vivo or ex vivo immunotherapy of cancer. DNA (III) that encodes 9D7 can be used similarly and cells that express 9D7 are useful in cellular anticancer vaccines. Antibodies (Ab) specific for 9D7 are useful for imaging, diagnosing and monitoring cancers, also, when conjugated to cytotoxins or radiomuclide, as therapeutic agents. Peptides derived from 9D7 may also be used diagnostically to test for an immune response. 9D7-associated cancers are particularly kidney, lung, colon and breast carcinoma and Hodgkin's lymphoma. AAB10874 B10899 represent immunogenic fragments of the human tumor-associated antigen 9D7 which is described in the method of the invention 8X86888888888XX

Novel synthetic fibrin-binding moiety, useful for detecting, imaging or localizing fibrin-containing clots by magnetic resonance imaging, radioimaging and for treating diseases involving thrombus formation e.g.

Claim 4; Page 55; 89pp; English.

The invention relates to a synthetic fibrin binding group having affinity for fibrin. The invention is useful for detecting fibrin in a mammalian subject which involves (a) detectably labelling the binding group; (b) administering to the subject the labelled polypeptide, and (c) detecting the labelled polypeptide in the subject. The invention is useful for treating a disease involving thrombus formation eg. deep-vein thrombosis, pulmonary embolism, cardiogenic thrombosis, atherosclerosis, myocardial infarct, reperfusion ischaemia or stroke. The binding moieties are useful for detection, imaging and localisation of fibrin-containing clots by magnetic resonance imaging, radioimaging and other imaging methods and are also useful in the diagnosis and treatment of coronary conditions where fibrin plays a role. The fibrin binding moieties are useful for

peptides, are used to induce a humoral and/or cellular response for use

ucrecturing and ucaquious participates in which itemin prays a role eg. peritoneal adhesions which often occur after surgery or inflammatory and neoplastic processes and are comprised of a fibrin network, fibroblasts, macrophages and new blood vessels, theumatoid carthritis, lupus or septic arthritis which often have bits of fibrin containing tissues called rice bodies in the synovial fluid of their joints; thrombocytopenic purpura, a type of anaemia in which deposits in arterioles causes turbulent blood flow resulting in stress and destruction of red blood cells. The fibrin specific agents can also be used to detect hypoxia or ischaemia of heart, kidney, liver, lung, brain or or other organs, as well as the detection of tumours, diabetic retinopathy, early or high-risk atherosclerosis and other autoimmune and inflammatory disorders. Fibrin specific agents also could provide both direct or surrogate markers of disease models in which hypoxia and angiogenesis are expected to play a role. The invention is also useful for screening molecular libraries. The present sequence is a fibrin detecting and diagnosing numerous pathophysiologies in which fibrin plays

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 16, Application US/09761636A

Patent No. US20020065218A1

GENERAL INFORMATION

APPLICANT: ACHEN, Marc

APPLICANT: STACKER, Steven

APPLICANT: CENDRON, Angela

TITLE OF INVENTION: VEGF-D/VEGF-C/VEGF PEPTIDOMIMETIC INHIBITOR

FILE REFERENCE: 1064/4865 Achen et al

CURRENT APPLICATION NUMBER: US 60/176,293

PRIOR APPLICATION NUMBER: US 60/176,293

PRIOR APPLICATION NUMBER: US 60/176,293

PRIOR APPLICATION NUMBER: US 60/204,590

PRIOR PILING DATE: 2000-01-18

PRIOR PLIING DATE: 2000-05-16

NUMBER OF SEQ ID NOS: 34

SOFTWARE: PATENTIN VUMBER: US 60/204,590

PRIOR FILING DATE: 2000-05-16

SOFTWARE: PATENTIN VUMBER: US 60/204,590

Sequence 70, Application US/09160513

Patent No. 6410775

GENERAL INFORMATION:
APPLICANT: Victoria, Edward J.
APPLICANT: Victoria, David M.
APPLICANT: Jones, David M.
APPLICANT: TV, Lin
ITLE OF INVENTION: apL IMMUNOREACTIVE PEPTIDES, CONJUGATES THEREOF AND METHODS ON WIMBER OF SEQUENCES: 225
CORRESPONDENCE ADDRESS:
ADDRESSE: MORRISON & FORESTER
STREET: 755 PAGE MILL ROAD
CITY: PALO ALTO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 219, Application US/09258754
; Sequence 219, Application US/09258754
; Patent No. 6174687
; GENERAL INFORMATION:
; GENERAL INFORMATION:
; APPLICANT: Pasqualini, Erkki
; APPLICANT: Pasqualini, Renata
; APPLICANT: Rajotte, Daniel
; TITLE OF INVENTION: Methods of Identifying Lung Homing Molecules Using
; TITLE OF INVENTION: Membrane Dipeptidase
; TITLE OF INVENTION: Membrane Dipeptidase
; FILE REFERENCE: P-LJ 3443
; CURRENT APPLICATION NUMBER: US/09/258,754

Lote C.J., Weiss J.B.;

"Identification in urine of a low-molecular-weight highly polar
glycopptide containing cysteinyl-galactose.";

Biochem. J. 123:25P-25P(1917)

-!- FUNCTION: The identity of the glycoprotein from which this peptide
is derived is unknown. No physiological function has been
attributed. An erythrocyte membrane glycopeptide having a
similar structure has also been found.

PIR; A03188; XGHUEU.

                              Anal. Biochem. 199:45-50(1991).

-!- FUNCTION: This enzyme catalyzes the hydrolysis of the N-terminal peptide bond of an N-acetylated peptide to generate an N-acetylated amino acid and a peptide with a free N-terminus. It preferentially cleaves off Ac-Ala, Ac-Met and Ac-Ser.

-!- CATALYTIC ACTIVITY: Acylaminoacyl-peptide + H(2)O = acylamino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sex pheromone CCF10.
